Canon: Role Brief for Tanishka Gawale, Project Manager and Pitch Lead

For: Tanishka Gawale, with backup from Prathmesh Shinde, Dhruv Patil and Tanishka Bellale **Purpose:** explain what the Project Manager and Pitch Lead owns, show what was contributed with proof, and keep every claim true **Built from:** your task document, the Canon Project Plan, PRD, standards and phased task document, and the Round 1 submission form | **Prepared:** 25 Oct 2026

How to use this: everything marked **[FILL]** needs your own status, number or link before you say it out loud. Round 2 and Round 3 items are planned work until you mark them done.

1. Check this first: who submits the Round 1 form

Your task document says the team leader submits once and members do not submit separately. The Round 1 form you were given says the opposite: **every member must submit separately**, each with the same team name and project, each describing the part they personally worked on. A team whose members do not submit is judged only on the submissions received.

This changes your task R1-PM1. Confirm against the official brief today, then tell the team. Until confirmed, assume every member submits.

Form requirement	What you need to do
One submission per person, same team name and project	Share one agreed team name and a one-paragraph project description with everyone
Team name in capital letters, matching exactly	Fix the exact spelling once and post it in the team channel
Each member's own email and role	Collect them (task R1-PM2)
A PDF in Google Drive, set to "Anyone with the link can view"	Agree who uploads it, or whether each person uploads the same PDF; test the link in a private window

Form requirement	What you need to do
Description of the part you personally worked on	Each member writes their own; you check none overclaims

2. My role in one minute

My job as Project Manager and Pitch Lead is to keep scope honest, own every submission, and make sure everything we say is true and demonstrable. Judges reward a plan that can be finished, and in Round 1 feasibility carries 15 of 100 points according to the task document.

The 60-second version (delete any sentence you cannot back with a file or a link):

> "I'm Tanishka Gawale, the project manager and pitch lead. A hackathon team wins by finishing a reliable flow, not by listing features, so my job was to keep scope honest. I agreed a cut order with the team: images go first, then DOCX and PDF input, then AI-proposed rules, then the size of the evaluation set, then backtest depth. We never cut the verifier, the human approval gates, the audit log or Rule Health. I assembled the submission, **[FILL: collected every member's details]**, and wrote the AI-tool disclosure so judges know exactly which tools helped. I also own the demo script and the judge answers, and I check that every number we say comes from our own evaluation or is labelled demo data."

The 20-second version:

> "I kept the scope finishable and the claims honest: a written cut order, a rehearsed four-minute demo, and a rule that every number comes from our own harness or is labelled as demo data."

If you blank out, say these five things:

1. The problem: AI makes content cheap, but review capacity does not grow with it.
2. What is different: every finding has a verified receipt, and overrides improve the rules.
3. What I did: kept scope finishable, owned submissions, wrote the demo script and judge answers.
4. What is honest: demo data is fictional and labelled, numbers come only from our harness.

5. What we do not claim: legal compliance, "unique", or any figure we did not measure.

3. What I contributed

Fill the Status column honestly: **done**, **partly done** or **not done**. Only describe as your contribution what the Proof column can show.

Area	What I produced	Task IDs	Why it matters to a judge	Proof to show	Status
Round 1 submission	Proposal assembled on the official PDF format; formats, dates and deadlines checked against the official brief; submission confirmation saved	R1-PM1	A complete submission on time, in the required format	Submission confirmation	**[FILL]**
Team details	Each member's email, phone, college and GitHub collected, no field invented	R1-PM2	A complete, accurate team section	Completed Section 11	**[FILL]**
AI-tool disclosure	Statement agreed with Dhruv, placed in the PDF and the README	R1-PM3	Honest disclosure of AI-assisted work, as the event requires	The statement	**[FILL]**
Scope gate and cut order	Written Round 2 scope gate, cut order and daily check-in times, shared with the team	R1-PM4	Shows a plan that can be finished	Message in the team channel	**[FILL]**
Repo documents	PRD, architecture, AI rules and task list copied into docs/ as PRD.md, ARCHITECTURE.md, AI_RULES.md, TASKS.md (with Dhruv)	P0-T02	Anyone can see the design basis	Files in the repo	**[FILL: Round 2]**
Version record	docs/versions.md listing each pinned library and model, from Dhruv's verified versions	P0-T03	No claims about tools from memory	docs/versions.md	**[FILL: Round 2]**

Area	What I produced	Task IDs	Why it matters to a judge	Proof to show	Status
Demo script	A four-minute path: rules approved, draft submitted, verified findings, override, Rule Health flag, backtest, v1.1; run end to end by someone who did not write it	P14-T04	A demo that survives a stranger running it	Script and a run by another teammate	**[FILL: Round 2]**
Daily QA	One QA pass per role (creator, reviewer, approver, brand manager); defects logged and assigned	P14-T07	Reliability visible to judges	docs/qa.md	**[FILL: Round 2]**
README	What Canon is, setup in under 5 commands, architecture summary, demo credentials, limits, AI disclosure; a teammate sets up from it alone	P14-T11	Judges can run it	README and the teammate's test	**[FILL: Round 2]**
Round 2 submission	Features completed, features left undone, stack, testing notes, next steps, and the three named Round 3 improvements	P14-T12	Honest status including what is not done	The submission	**[FILL: Round 2]**
Code freeze	Freeze called and release tagged before the deadline	P14-T14	A stable thing to present	Tag in the repo	**[FILL: Round 2]**
Evaluation report	Written with Prathmesh; every number traces to the harness	P12-T10	Measured results with limits stated	docs/eval_report.md	**[FILL: Round 3]**
Judge answers	One-page Q&A on competitors, hallucinations, privacy, scale, why deterministic first, and what is not claimed	P14-T13	Prepared, sourced answers	The one-pager	**[FILL: Round 3]**
Fallback demo video	Recorded video that plays offline; cached LLM results confirmed with Dhruv	P14-T06	A demo that survives a network or API failure	The video file	**[FILL: Round 3]**

Area	What I produced	Task IDs	Why it matters to a judge	Proof to show	Status
Final fact check	Model name, provider retention terms and competitor claims re-checked with Prathmesh; slides updated	P14-T09	No unverified claim on a slide	Updated slides and sources	**[FILL: Round 3]**
Final submission and pitch	Every number confirmed as harness output or labelled demo data; claims checklist signed	R3-PM1	Nothing overclaimed	Signed checklist	**[FILL: Round 3]**

The sentence that ties it together: "Our product promises evidence. My contribution is that the plan, the submissions and the pitch make only claims we can prove."

4. How my work shows up in the pitch

The four-minute demo path is your script. Hand each part to the person who built it.

Step	What the judge sees	Who can speak to it
0. Set-up line	"All data is fictional; past submissions behind Rule Health are seeded demo data, labelled in the product."	You
1. Brand manager approves rules and publishes policy v1.0	Nothing is enforced until a human approves it	You, with Prathmesh on the rules
2. Creator submits the draft	Five planted issues, including "guarantees zero processing delays"	Prathmesh
3. Findings with verified source quotes; hidden instruction flagged	Evidence on every finding; hostile input is data	Dhruv
4. Reviewer overrides one finding with a reason code	Humans decide; decisions are recorded	Tanishka Bellale on the screens
5. Rule Health flags the rule; a scoped exception is proposed	Overrides become rule diagnosis	You or Dhruv

Step	What the judge sees	Who can speak to it
6. Backtest runs	Changes are tested before they ship	Dhruv
7. Policy v1.1 approved	The loop closes with a human approval	You, as the close

5. Questions I lead on

How did you keep this feasible in the time? We agreed a written cut order in advance: images first, then DOCX and PDF input, then AI-proposed rules, then the evaluation set size, then backtest depth. The verifier, the human approval gates, the audit log and Rule Health are never cut. Status of each item: **[FILL: built, partly built, cut]**.

What is built, and what is not? Answer from the completed-features list and known gaps that the team hands you before each deadline. Never describe a planned or cut feature as working.

How do you make sure the numbers are true? Every number on a slide or in the README comes from the evaluation harness or a documented test, or is labelled demo data. Competitor details are vendor-stated and re-checked before the pitch: **[FILL: date re-checked]**.

How did the team work together? Daily check-ins at **[FILL: agreed times]**, a daily QA pass per role with defects logged and assigned, one named owner per task, and task IDs cited in commits and pull requests.

Did AI write your code? We disclose it: **[FILL: tools, recorded by Dhruv Patil]**. Every AI-written change was reviewed by a human.

Does it make us legally compliant? No. Canon supports human review, gives no legal advice and does not guarantee compliance.

What is new here? Only the loop: overrides with reason codes, rule diagnosis, a proposed versioned change, a backtest and human approval. We say "we found no equivalent", never "unique".

6. Team ownership: who answers what

Agree this before presenting. Each person claims only what they can show in a file, a link or a test result.

Topic	Lead answerer	Cue line
Story, scope, plan, submissions, what is next	Tanishka Gawale	(you lead)
Problem evidence, competitors, domain fit, demo data, labelled set	Prathmesh Shinde	"Prathmesh verified the sources; Prathmesh?"
Architecture, verifier, security, AI pipeline, tools used	Dhruv Patil	"Dhruv built that part."
Screens, accessibility, review workflow	Tanishka Bellale	"Tanishka B. built that screen."
Numbers you cannot recall	Whoever wrote the report	"That is in our evaluation report, copied from the harness."
Something unmeasured	Anyone	"We have not measured that."

7. Say this, not that

Say	Do not say
"We found no equivalent in our research"	"Unique", "the only tool"
"Precision X on our own labelled set of N" (from the harness)	Any accuracy, time-saving or cost figure we did not measure
"Vendor-stated" for every competitor fact	Competitor features as verified fact
"Supports human review"	"Ensures legal compliance"
"Seeded demo data, fictional company"	Seeded history presented as real customer data
"Planned" or "not built yet"	Describing a cut feature as working

Say	Do not say
"The model has no tools and no write access"	"The AI can never be wrong"

Also avoid the name "BrandGuard" (a product with that name already exists), and make sure "Canon" has passed the trademark check before you present it as final.

8. Handoffs I depend on

From	To	What is handed over	Needed by
Prathmesh Shinde	Dhruv Patil	Fixture policy, terms and claims CSVs, test sample tables, demo draft	Round 2, Day 1 to 2
Prathmesh Shinde	Dhruv Patil	Seeded history design and adversarial samples	Round 2, Day 3
Dhruv Patil	Tanishka Bellale	OpenAPI schema and endpoint contracts; working endpoints per phase	Start of Round 2; refreshed daily
Tanishka Bellale	Dhruv Patil, Tanishka Gawale	Screens deployed behind the same origin; Playwright script	Round 2, Day 3
Dhruv Patil	Tanishka Gawale	Verified versions, provider terms, security notes	Round 1; updated at Round 3
All	Tanishka Gawale	Completed-features list and known gaps	Before each submission deadline

9. Open items to settle before Round 2

1. Who submits: the form says every member submits, your task document says the leader submits once. Confirm against the official brief.
2. Hosted model and its retention terms.
3. Supabase versus local Postgres. The architecture image shows Supabase for production and SQLite for local development, while the standards document specifies PostgreSQL.

4. Sync versus async database sessions (the standards document says sync by default).
5. Whether the design system is finished or shadcn/ui defaults are used.
6. The Round 1 submission text and PDF: the Project Plan lists them as not yet written.

10. My answer for the Round 1 form: "What did YOU personally build or contribute?"

Keep only the lines that are true.

> "My role is Project Manager and Pitch Lead. In Round 1 I [assembled the proposal on the official PDF format and confirmed the dates and formats against the brief], [collected every member's details for the team section], [wrote the AI-tool disclosure statement with Dhruv], and [agreed the scope gate, cut order and daily check-in times with the team]. For Rounds 2 and 3 I own the demo script, the QA log, the README, the submissions, the evaluation report with Prathmesh, the judge answers and the final claims check. No product code written by me."

11. Final checks before you present

- [ ] Every **[FILL]** in this document is replaced or the sentence removed.
- [ ] Every number comes from the harness or a documented test.
- [ ] Competitor facts were re-checked this week and carry a vendor-stated label.
- [ ] The demo has been run end to end three times in a row, once by someone who did not write the script.
- [ ] Cached model results and the deterministic fallback work if the AI service is down.
- [ ] The fallback demo video plays offline.
- [ ] Seeded history is labelled as demo data in the product and on the slides.
- [ ] Code is frozen and tagged.
- [ ] The claims checklist is signed.
